## **Vacature Backend Developer**

### **Everything starts with identity!**

Never received that second hand purchase you made online? Or maybe, having a daughter or niece chat online with some “boyfriend”? Think of it, today, how can you trust the party on the other side?

Well, we have the vision to make this possible by introducing identity as the missing piece of the web. Where people can trust one another with respect to each other privacy.

And now you have the possibility to contribute to this idea and help build our identity platform and integrate with the smart city platform in Belgium for the Flemish cities and municipalities. Join our team now

### **Backend Engineer**

As a backend engineer you are the one responsible for writing and improving a platform that handles millions of identities. This shit has to be fast as lightning and stable as a rock.

The foundation is already build using Elixir, an awesome functional language and by adopting an event driven architecture to handle the load and support our vision. Everything is validated in the blockchain.

We don't do corporate shenanigans and are allergic to paperwork.

Your job, bulletized

- You work to get shit done.
- You're in it for the code.
- Thinking in abstractions comes naturally.
- You're self dependent and ever curious
- You have a degree in CS and/or similar in experience

If you believe that you have what it takes, the let's get talking
